Modules available for iCON 230V Fan Range

Airflow® iCON® fans can be controlled by optional control modules. For the 230V range you can choose between seven modules.

* For blister pack add "B" at the end of part number.
** Not for kitchen applications with iCON 15! Approved Document Part F required continuous extract rates: 6 l/s for WC, 8 l/s for bathroom / utility room and 13 l/s for kitchen.

SAFETY FIRST: ALWAYS ISOLATE THE FAN UNIT FROM THE POWER SUPPLY BEFORE DOING ANY WORK ON THE FAN/MODULE.

Electrical installation

All electrical installation must be carried out by an approved electrician in accordance with Approved Document Part P of U.K. Building Regulations and to the latest IET standards, or the appropriate regulations in the country of installation (for fan installation see the iCON 230V Fan Range Installation and Operating Guide).

Diagram A - module wiring with no external switching (module functionality / pull cord activation only):

Diagram B - module wiring with external switching (live trigger connection used):

Mechanical installation

To install the module in an iCON fan follow the instructions below. See page 5 for instructional drawings.

1. Remove the fan front cover (see page 7).
2. Lift the fan electrical terminal away from its mounting pillars and position on the module connector pins. Tighten the two screws with a suitable screwdriver. Ensure the leads are under the module retaining cable clamp.
3. Fit the module at a slight angle into the fan housing, ensuring that the locating slot is fully engaged into the locating block on the fan.
4. Push the module against housing, ensuring the module clip holds it in place (clicks at the cable clamp). With iCON 15 & 30 the terminal will reposition back over mounting pillars.

For modules with pull cords: Ensure that the pull cord is properly located within the cord slot at the bottom of the fan.

For modules with PIR control: Remove the oval logo cap fitted at the bottom of the front cover of the fan. Replace it with translucent lens supplied with the PIR module. Note: The lens must be replaced in order for the PIR module to function properly. Ensure the orientation of the lens is correct (i.e. the lens should be flush with the surface).

Connecting mains cable into the module

Connect the cable to the 3-way supply connector block (see wiring diagrams on page 3) ensuring that the supplied cable clamp is fitted. Refit the front cover.

Note: When using DTM module on initial connection the fan will start immediately and continue running for the duration set on the timer function of the module.
Mechanical installation

Module adjustment

A module with Timer and/or Humidistat is supplied pre-set, but may be adjusted by the installer. All adjustments must be done using the supplied Adjustment Tool.

Humidity settings

The humidistat is factory pre-set at approx. 70% RH (relative humidity). Adjusting the “% RH” towards 40% will result in fan activation at lower humidity (more sensitive). Adjusting the “% RH” towards “90%” will result in fan activation at higher humidity (less sensitive).

Time settings

The overrun timer is factory pre-set at approx. 15 min. Adjusting the “Timer” towards “MIN” will result in a timer overrun decrease towards 1/2 minutes (depends on module). Adjusting the “Timer” towards “MAX” will result in a timer overrun increase towards 30/45 minutes (depends on module).

2SHM speed settings

The bathroom/kitchen (low/high) trickle speed depends on fan model used: 7.2/9.5 l/s (iC15), 19.2/23.4 l/s (iC30) or 21.2/25.6 l/s (iC60). You can set it by a two position slide switch. Boost (pull cord or humidity sensor activated) will always be fans’ maximum speed.

Front cover removal

To remove front cover assembly, first make sure the fan is off, isolated from the power supply and the iris shutter is fully closed.

1. Undo the locking screw at the bottom edge of the cover using a screwdriver.

2. Rotate the cover a few degrees anticlockwise until it clicks out from the fittings.

3. Remove the cover by pulling it out.

To refit the cover, reverse the above procedure. The iris shutter should be in closed position after refit. If not, wait approximately 1 min after fan switch off allowing the actuator to retract back in the closed position and then refit the cover again.
